

## **Odour Control with QuikAir™ Concentrate**

Introducing QuikAir™ Concentrate from GOC Technologies, a revolutionary new type of air atomisation product designed for deodorisation of large outdoor areas such as compost sites, landfills, and wastewater plants.

In typical atomisation deodorisers, the deodoriser becomes part of the water used to dilute it. Consequently, the dilution rate is limited, and the deodorisation quality is lost when the water droplets fall to the ground. Not so with QuikAir™!

QuikAir™ is specially formulated to weigh 8% less than water and evaporate 20% faster than water, allowing it to separate from the diluting agent and become a gaseous compound microseconds after it leaves the nozzle. This keeps QuikAir™ in the air longer, and dramatically increases the odds of the deodoriser contacting the offensive gases (odours).

QuikAir™ concentrate can be diluted between 0.5 and 0.125 %, this will be determined on site by the strength of the odour, the type of application equipment used, and the pressure applied at the nozzle.

As with all GOC® products, QuikAir™ is completely non toxic, eco-friendly, and biodegradable.

QuikAir™ Concentrate is supplied in 200 litre drums of 1000 litre IBC's.
